

# Package ‘pandaR’

October 16, 2018

**Title** PANDA Algorithm

**Version** 1.12.0

**Author** Dan Schlauch, Joseph N. Paulson, Albert Young, John Quackenbush, Kimberly Glass

**Maintainer** Joseph N. Paulson <jpaulson@jimmy.harvard.edu>, Dan Schlauch <dschlauch@fas.harvard.edu>

**Description** Runs PANDA, an algorithm for discovering novel network structure by combining information from multiple complementary data sources.

**Depends** R (>= 3.0.0), methods, Biobase, BiocGenerics,

**Imports** matrixStats, igraph, ggplot2, grid, reshape, plyr, RUnit, hexbin

**Suggests** knitr

**biocViews** StatisticalMethod, GraphAndNetwork, Microarray, GeneRegulation, NetworkInference, GeneExpression, Transcription, Network

**VignetteBuilder** knitr

**License** GPL-2

**LazyData** true

**RoxygenNote** 5.0.1

**git\_url** <https://git.bioconductor.org/packages/pandaR>

**git\_branch** RELEASE\_3\_7

**git\_last\_commit** 2d77c0f

**git\_last\_commit\_date** 2018-04-30

**Date/Publication** 2018-10-15

calcDegree	<i>Calculate regulatory network degree</i>
------------	--

---

## Description

Calculates the transcription factor out-degree or gene in-degree for the estimated panda regulatory network.

## Usage

```
calcDegree(x, type = c("tf", "gene"), filter = FALSE, trim = FALSE, ...)
```

## Arguments

x	An object of class "panda" or matrix
type	Character string - 'tf' or 'gene'
filter	Boolean to force negative degrees to zero
trim	Boolean to trim using topedges or not at a cutoff (weights become binary 1,0)
...	Options to be passed to topedges function

## Examples

```
data(pandaToyData)
pandaRes <- panda(pandaToyData$motif,
                 pandaToyData$expression,pandaToyData$ppi,hamming=.001,progress=TRUE)
calcDegree(pandaRes)
calcDegree(pandaRes,trim=TRUE,cutoff=1.5)

data(pandaResult)
calcDegree(pandaResult,type="tf",trim=TRUE,1000)
calcDegree(pandaResult,type="gene",trim=TRUE,1000)
```

---

calcDegreeDifference    *Calculate difference in degrees*

---

### Description

Calculates the transcription factor out-degree or gene in-degree for two different panda regulatory networks. This is useful in comparing networks from two phenotypes.

### Usage

```
calcDegreeDifference(x, y, type = c("tf", "gene"), filter = FALSE,
  trim = FALSE, ...)
```

### Arguments

x	An object of class "panda" or matrix
y	A second object of class "panda" or matrix
type	Character string - 'tf' or 'gene'
filter	Boolean to force negative degrees to zero
trim	Boolean to trim using topedges or not at a cutoff (weights become binary 1,0)
...	Options to be passed to topedges function

### Examples

```
data(pandaToyData)
pandaRes <- panda(pandaToyData$motif,
  pandaToyData$expression, pandaToyData$ppi, hamming=.001, progress=TRUE)
pandaRes2 <- panda(pandaToyData$motif,
  pandaToyData$expression, pandaToyData$ppi, hamming=.1, progress=TRUE)
calcDegreeDifference(pandaRes, pandaRes2)
calcDegreeDifference(pandaRes, pandaRes2, trim=TRUE, cutoff=1.5)
```

---

importPandaMatlab    *Panda Matlab importer*

---

### Description

Imports the files from the exportPanda.m file.

### Usage

```
importPandaMatlab(dir = getwd(), celldata = "celldata.dat")
```

### Arguments

dir	Working directory to search for the numeric files.
celldata	Name of the 'celldata.dat' file.

**Value**

Two column vector of "regulator" and "target"

**Examples**

```
# determine gene degree
pandaFiles = importPandaMatlab()
indegree <- ddply(pandaFiles[,2:ncol(pandaFiles)], .(targer), numcolwise(sum))
row.names(indegree) <- indegree[,1]
indegree <- indegree[,-1]
# to export the file
networkfiles = list.files(pattern="numeric")
write.table(indegree,paste("indegree_",networkfiles,sep=""),
            sep="\t",quote=F,row.names=T,col.names=T)
```

---

multiplot

*Multiple plots*

---

**Description**

Multiple plot function as described in: [http://www.cookbook-r.com/Graphs/Multiple\\_graphs\\_on\\_one\\_page\\_\(ggplot2\)/](http://www.cookbook-r.com/Graphs/Multiple_graphs_on_one_page_(ggplot2)/). If the layout is something like `matrix(c(1,2,3,3), nrow=2, byrow=TRUE)`, then plot 1 will go in the upper left, 2 will go in the upper right, and 3 will go all the way across the bottom.

**Usage**

```
multiplot(..., plotlist = NULL, cols = 1, layout = NULL)
```

**Arguments**

...	ggplot objects can be passed in or to plotlist (as a list of ggplot objects).
plotlist	NULL - if the plotlist is null, the function will figure out the panel dimensions.
cols	Number of columns in layout.
layout	A matrix specifying the layout. If present, 'cols' is ignored.

---

panda

*Passing Messages between Biological Networks to Refine Predicted Interactions*

---

**Description**

This function runs the PANDA algorithm

**Usage**

```
panda(motif, expr = NULL, ppi = NULL, alpha = 0.1, hamming = 0.001,
      iter = NA, output = c("regulatory", "coexpression", "cooperative"),
      zScale = TRUE, progress = FALSE, randomize = c("None", "within.gene",
      "by.gene"), cor.method = "pearson", scale.by.present = FALSE,
      edgelist = FALSE, remove.missing.ppi = FALSE,
      remove.missing.motif = FALSE, remove.missing.genes = FALSE)
```

**Arguments**

motif	A motif dataset, a data.frame, matrix or exprSet containing 3 columns. Each row describes an motif associated with a transcription factor (column 1) a gene (column 2) and a score (column 3) for the motif.
expr	An expression dataset, as a genes (rows) by samples (columns) data.frame
ppi	A Protein-Protein interaction dataset, a data.frame containing 3 columns. Each row describes a protein-protein interaction between transcription factor 1(column 1), transcription factor 2 (column 2) and a score (column 3) for the interaction.
alpha	value to be used for update variable, alpha (default=0.1)
hamming	value at which to terminate the process based on hamming distance (default $10^{-3}$ )
iter	sets the maximum number of iterations PANDA can run before exiting.
output	a vector containing which networks to return. Options include "regulatory", "coregulatory", "cooperative".
zScale	Boolean to indicate use of z-scores in output. False will use [0,1] scale.
progress	Boolean to indicate printing of output for algorithm progress.
randomize	method by which to randomize gene expression matrix. Default "None". Must be one of "None", "within.gene", "by.genes". "within.gene" randomization scrambles each row of the gene expression matrix, "by.gene" scrambles gene labels.
cor.method	Correlation method, default is "pearson".
scale.by.present	Boolean to indicate scaling of correlations by percentage of positive samples.
edgelist	Boolean to indicate if edge lists instead of matrices should be returned.
remove.missing.ppi	Boolean to indicate whether TFs in the PPI but not in the motif data should be removed.
remove.missing.motif	Boolean to indicate whether genes targeted in the motif data but not the expression data should be removed.
remove.missing.genes	Boolean to indicate whether genes in the expression data but lacking information from the motif prior should be removed.

**Value**

An object of class "panda" containing matrices describing networks achieved by convergence with PANDA algorithm.

"regNet" is the regulatory network

"coregNet" is the coregulatory network

"coopNet" is the cooperative network

## References

Glass K, Huttenhower C, Quackenbush J, Yuan GC. Passing Messages Between Biological Networks to Refine Predicted Interactions. PLoS One. 2013 May 31;8(5):e64832.

## Examples

```
data(pandaToyData)
pandaRes <- panda(pandaToyData$motif,
                 pandaToyData$expression,pandaToyData$ppi,hamming=.1,progress=TRUE)
```

---

pandaR	<i>pandaR: Passing Messages between Biological Networks to Refine Predicted Interactions.</i>
--------	---

---

## Description

The PANDA approach is to model the regulatory network as a bipartite network and estimate edge weights based on the evidence that information from a particular transcription factor  $i$  is successfully being passed to a particular gene  $j$ . This package provides a straightforward tool for applying this established method.

---

pandaResult	<i>Analysis result from PANDA algorithm on toy data</i>
-------------	---

---

## Description

This data panda object resulting from running the PANDA algorithm on the supplied toy dataset.

```
data(pandaToyData) pandaResult <- panda(pandaToyData$motif, pandaToyData$expression,pandaToyData$ppi,hamming=.1,progress=TRUE)
```

## Usage

```
pandaResult
```

## Format

A panda object

## Value

A panda object

## References

---

pandaResultPairs	<i>Analysis result from PANDA algorithm on toy data converted into pairs</i>
------------------	--

---

**Description**

This data panda object resulting from running the PANDA algorithm on the supplied toy dataset. The data consists of a matrix of TF, Gene, initial link, and final Z. data(pandaResultPairs)

**Usage**

```
pandaResultPairs
```

**Format**

A matrix

**Value**

A matrix

**References**

Glass K, Huttenhower C, Quackenbush J, Yuan GC. Passing Messages Between Biological Networks to Refine Predicted Interactions. PLoS One. 2013 May 31;8(5):e64832.

---

pandaToyData	<i>Toy gene expression, motif, and ppi data</i>
--------------	---

---

**Description**

This data is a list containing three data.frames. The motif data.frame describes a set of pairwise connections where a specific known sequence motif of a transcription factor was found upstream of the corresponding gene. The expression data.frame is a set of 1000 gene expression levels measured across 50 samples. Finally, the ppi data.frame describes a set of known pairwise protein interactions.

**Usage**

```
pandaToyData
```

**Format**

A list containing 3 data.frames

**Value**

A list of length 3

**References**

Glass K, Huttenhower C, Quackenbush J, Yuan GC. Passing Messages Between Biological Networks to Refine Predicted Interactions. PLoS One. 2013 May 31;8(5):e64832.

---

plot.panda

*Plot.panda*

---

**Description**

summarizes the results of a PANDA analysis

**Usage**

```
plot.panda(x, ...)
```

**Arguments**

x                    an object of class "panda"  
 ...                  further arguments passed to or from other methods.

**Value**

Plot of the distribution of edge weights in the regulatory network.

**Examples**

```
data(pandaToyData)
panda.res <- panda(pandaToyData$motif,
                  pandaToyData$expression, pandaToyData$ppi, hamming=.001, progress=TRUE)
plot(panda.res)

data(pandaResult)
plot(pandaResult)
```

---

plotCommunityDetection

*Community detection plot*

---

**Description**

This function performs community detection on an undirected PANDA network. The function optionally returns the graph and community.

**Usage**

```
plotCommunityDetection(x, scaleEdge = 5, verbose = TRUE, ...)
```

**Arguments**

x                    Toy PANDA output represented as a TF, Gene, and Score.  
 scaleEdge          Visualization parameter for the edges.  
 verbose            TRUE/FALSE - Report community structure.  
 ...                Options for the plot function.

**Value**

Optionally return a list with the graph and community.

**Examples**

```
# start with some toy PANDA output
mat <- cbind(rep(1:5, each=10), rep(seq(11,20),5), sample(100, 50)/100)
x =plotCommunityDetection(mat)
str(x)

#example of very different edges
set.seed(1)
subst <- sample(50,10)
mat[subst, 3] <- subst
plotCommunityDetection(mat,scaleEdge=0.5)
```

---

plotGraph

*Plot graph*

---

**Description**

plotGraph plots a bipartite graph

**Usage**

```
plotGraph(x)
```

**Arguments**

x                    an object of class "panda"

**Value**

An matrix describing the subsetted bipartite network.

**Examples**

```
data(pandaToyData)
pandaRes <- panda(pandaToyData$motif,
                 pandaToyData$expression,pandaToyData$ppi,hamming=.001,progress=TRUE)
topPandaRes <- topedges(pandaRes,1000)
subnet.pandaRes <- subnetwork(topPandaRes,c("AR","ARID3A","ELK1"))
plotGraph(subnet.pandaRes)

data(pandaResult)
topPandaRes <- topedges(pandaResult, 1000)
subnet.pandaRes <- subnetwork(topPandaRes,c("AR","ARID3A","ELK1"))
plotGraph(subnet.pandaRes)
```

---

plotZ *Comparison of Z scores between two PANDA runs*

---

### Description

Given two PANDA objects with the same network structure, plot the Z-score comparison. The two PANDA objects should only differ in the gene expression used for the network constructions or other parameters.

### Usage

```
plotZ(x, y, hex = TRUE, bins = 200, addLine = TRUE, rank = FALSE)
```

### Arguments

x	PANDA object - output of the panda function.
y	PANDA object - second PANDA object.
hex	TRUE/FALSE - If TRUE, bin data points to avoid over plotting.
bins	Number of bins to use for plotting.
addLine	TRUE/FALSE - to add y=x line.
rank	TRUE/FALSE - If TRUE, plot rank of edge weights rather than weight values.

### Value

ggplot comparing the Z-scores between the two networks.

### Examples

```
data(pandaResult)
data(pandaToyData)
pandaRes <- pandaRes2 <- pandaResult
plotZ(pandaRes, pandaRes2)

panda.res1 <- with(pandaToyData, panda(motif, expression, ppi, hamming=1))
panda.res2 <- with(pandaToyData, panda(motif, expression +
  rnorm(prod(dim(expression)),sd=5), ppi, hamming=1))
plotZ(panda.res1, panda.res2,addLine=FALSE)
```

---

plotZbyTF *Plot Z by TF out-degree quantiles*

---

### Description

Generates a Z-score scatterplot for edges according to the TF outdegree in prior. The two PANDA objects should only differ in the gene expression used for the network constructions or other parameters.

**Usage**

```
plotZbyTF(x, y, motif, hasPrior = TRUE, cuts = 1, cols = 2)
```

**Arguments**

x	PANDA object - output of the panda function.
y	PANDA object - second PANDA object.
motif	Motif used to construct the networks.
hasPrior	TRUE/FALSE, If TRUE plots the edges that are given a weight > 0 in the motif, else plot those given a weight of 0
cuts	either a numeric vector of two or more unique cut points or a single number (greater than or equal to 2) giving the number of intervals into which 'x' is to be cut.
cols	Number of columns in layout.

**Value**

ggplot heatmap for each TF, get outdegree in regulatory prior

**Examples**

```
data(pandaResult)
data(pandaToyData)
plotZbyTF(pandaResult,pandaResult, pandaToyData$motif, hasPrior=TRUE)
plotZbyTF(pandaResult,pandaResult, pandaToyData$motif, cuts=2)
```

---

print.panda

*print.panda*

---

**Description**

summarizes the results of a PANDA analysis

**Usage**

```
## S3 method for class 'panda'
print(x, ...)
```

**Arguments**

x	an object of class "panda"
...	further arguments passed to or from other methods.

**Value**

Summary description of panda S4 object

**Examples**

```

data(pandaToyData)
panda.res <- panda(pandaToyData$motif,
                  pandaToyData$expression,pandaToyData$ppi,hamming=.001,progress=TRUE)
print(panda.res)

data(pandaResult)
print(pandaResult)

```

---

subnetwork

*Subnetwork*

---

**Description**

subnetwork gets a bipartite network containing only the transcription factors or genes and their respective connections

**Usage**

```
subnetwork(x, nodes, subTf = TRUE)
```

**Arguments**

x	an object of class "panda"
nodes	character vector containing the transcription factor or gene labels to subset
subTf	an optional logical indicating whether to subset by transcription factor. Default is TRUE.

**Value**

An matrix describing the subsetted bipartite network.

**Examples**

```

data(pandaToyData)
pandaRes <- panda(pandaToyData$motif,
                 pandaToyData$expression,pandaToyData$ppi,hamming=.001,progress=TRUE)
topPandaRes <- topedges(pandaRes,1000)
subnet.pandaRes <- subnetwork(topPandaRes,c("AR","ARID3A","ELK1"))

data(pandaResult)
topPandaRes <- topedges(pandaResult,1000)
subnetwork(topPandaRes,c("AR","ARID3A","ELK1"))

```

---

summary.panda	<i>Summary.panda</i>
---------------	----------------------

---

**Description**

summarizes the results of a PANDA analysis

**Usage**

```
## S3 method for class 'panda'
summary(object, ...)
```

**Arguments**

object	an object of class "panda"
...	further arguments passed to or from other methods.

**Value**

Summary description of panda S4 object

**Examples**

```
data(pandaToyData)
panda.res <- panda(pandaToyData$motif,
  pandaToyData$expression, pandaToyData$ppi, hamming=.001, progress=TRUE)
summary(panda.res)

data(pandaResult)
summary(pandaResult)
```

---

targetedGenes	<i>targetedGenes</i>
---------------	----------------------

---

**Description**

Gets a set of genes targeted by a specified transcription factor. This function can be applied to a graph that is not complete, subsetting the edges which have non-zero edge weight. See function topEdges for dichotomizing edgeweights.

**Usage**

```
targetedGenes(x, tfs)
```

**Arguments**

x	an object of class "panda"
tfs	transcription factors to query

**Value**

A vector of targeted genes

**Examples**

```
data(pandaToyData)
pandaRes <- panda(pandaToyData$motif,
                 pandaToyData$expression, pandaToyData$ppi, hamming=.001)
topPandaRes <- topedges(pandaRes, 1000)
targetedGenes(topPandaRes, c("AR", "ELK1"))

data(pandaResult)
topPandaRes <- topedges(pandaResult, 1000)
```

---

testMotif

*Check motif*

---

**Description**

This function adds random false positive edges to the regulatory prior and will check if they become pruned.

**Usage**

```
testMotif(x, motif, expr, ppi, mode = c("augment", "remove"), prop = 0.05,
          seed = 1, ...)
```

**Arguments**

x	Model regulatory network.
motif	Motif used to construct the model regulatory network.
expr	Expression matrix used to construct model network.
ppi	PPI used to construct model regulatory network.
mode	a character string - either "augment" to add random edges or "remove" to remove random edges.
prop	numeric specifying number of edges to augment or remove from regulatory prior, as a proportion of the number of edges in the regulatory prior.
seed	Random seed.
...	Options for the panda function.

**Value**

ggplot heatmap list of indices of net corresponding to each TF

**Examples**

```
data(pandaToyData)
data(pandaResult)
regnet = slot(pandaResult, "regNet")
with(pandaToyData, testMotif(regnet, motif, mode="augment", expression, ppi, hamming=1))
```

---

topedges	<i>Top edges</i>
----------	------------------

---

**Description**

topedges gets a network from a panda obj with a specified cutoff based on magnitude of edgeweight.

**Usage**

```
topedges(x, count = NA, cutoff = 2, networks = c("coregulation",  
"cooperation", "regulatory"))
```

**Arguments**

x	an object of class "panda"
count	an optional integer indicating number of top edges to be included in regulatory network.
cutoff	an optional numeric indicating the z-score edge weight cutoff to be used to identify edges. Default is 2.0. Not used if count is not NA.
networks	an optional vector specifying which networks to be included in output. May be any combination of c("coregulation","cooperation","regulatory").

**Value**

An object of class "panda" containing binary matrices indicating the existence of an edge between two nodes. For regulatory network the matrix indicates an edge between a transcription factor (row) and a gene (column)

**Examples**

```
data(pandaToyData)  
pandaRes <- panda(pandaToyData$motif,  
  pandaToyData$expression,pandaToyData$ppi,hamming=.001,progress=TRUE)  
topPandaRes <- topedges(pandaRes,1000)  
  
data(pandaResult)  
topPandaRes <- topedges(pandaResult,1000)
```
